

## La piqûre de trop? (One Injection Too Many?)

### Investigative journalism

The HPV vaccine – also known as “vaccine against cervical cancer”- was celebrated as a remarkable medical breakthrough.

But is cervical cancer really a public health threat in industrialized countries? What kind of clinical records do actually exist? And first and foremost: How did this vaccine manage to become accepted so incredibly quickly despite its record price?

This book examines a shocking success story. It takes stock of today's state of knowledge, reveals existing studies and unanswered questions. And exposes the tremendous extent of organized “sensitization” that was set in motion by vaccine manufacturers. In the end, it raises the question about the immense gray area and conflicting interests connected to these vaccinations.

Much of the information that was collated in this investigation was never made accessible to the public. This book especially addresses the parents who received recommendations to get vaccinations for their daughters. Comprehensive clarification should help them in their decision making.

Catherine Riva, Jean-Pierre Spinosa, *La piqûre de trop? Pourquoi vaccine-t-on les jeunes filles contre le col de l'utérus?*, Xenia Publishing, 2010.

Foreword by Abby Lippman and Martin Winckler.

Epilog by Pierre-Yves Dubuis and Bernard Kunz
